Presentation

Master's degree in Chemistry at University of Basilicata. Ph.D. in Chemical Sciences at University of Basilicata (March 2014). During her academic training she has acquired a deep knowledge in organic and heterocyclic chemistry for synthesis of organic semiconductors and π -conjugated systems. During Ph.D. she has gained experience also in the field of physical chemistry making experience with techniques such as laser ablation and laser spectroscopies for nanomaterial preparation and characterizations, respectively. At this regard, she spent a period of research abroad at the LASERLAB EUROPE facility at FORTH - Institute of Electronic Structure and Lasers (Crete-Greece).

Since June 2016 she is a Researcher at ISM-CNR. Currently, she is in charge of the CheMiX Lab, the laboratory for chemical synthesis of new materials at the CNR-ISM Tito Scalo branch. Her research activities concern preparing organic-inorganic polymeric nanocomposite materials by wet chemistry useful as material for 3D printing. Moreover, she leads activities about the synthesis of novel organic heterocyclic π -conjugated molecules such as donors and acceptors useful for OSCs by studying their electronic properties both in the gas phase and as thin films by high-resolution XPS and XAS analysis taking advantage of synchrotron light radiation. Another field of activity is the synthesis and the spectroscopic characterization of new photoinduced Drug Delivery Systems based on metal nanoparticles useful to trap and release anti-tumoral drugs.

Research Interests

- Design and synthesis of π -conjugated organic systems, such as oligothiophene-based molecules and their spectroscopic characterization for applications in OSCs;
- Study and preparation of innovative nanocomposite polymers to be used for the 3D printed manufacturing of passive, active and programmable components in the field of automotive production processes to increase their efficiency, reliability, maintainability, sustainability and safety;
- Design, synthesis and spectroscopic characterization of new photoinduced Drug Delivery Systems based on metal nanoparticles useful to trap and release drugs;
- PES and NEXAFS Spectroscopies using synchrotron light of π -conjugated organic systems isolated in the gas phase and at the interface with technologically interesting surfaces (e.g., Au (111), Ag (110), ITO etc.).
